| images were generated considering the maximum saliency distance between the image generated by the GAN. The |
|--|
| lesions are placed in the opposite lung side from the original image from the dataset. p stands for probability. The |
| values highlighted in green show the data augmentation techniques in which the P-value achieved values lower than |
| 0.05, and thus the null hypothesis was rejected (i.e., there is a statistical difference and the results achieved are |
| better than without data augmentation). The underscored values show when training with the proposed salience |
| augmentation achieved a P-value lower than 0.05 when compared with training with the augmentation proposed |
| by (Krinski et al., 2023), and the null hypothesis was rejected. |

Table 7.4: Results of the salience version of the data augmentation evaluation when unifying the training sets. The
